

# SINGLE-WIDTH FANS WITH PLR WHEELS

- Capacities to 200,000 CFM
- PLR wheel choices
- Static pressures to 14"WG
- Class 1, 2, 3 construction

56 12th Avenue Extension

# SINGLE-WIDTH FANS

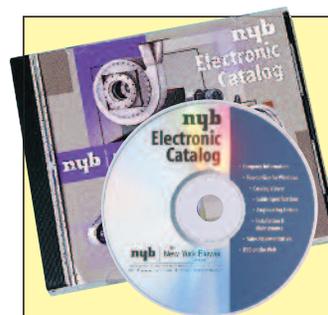

New York Blower's Single-Width Fans are designed for a wide range of applications from commercial-building ventilation to industrial dust-collection systems. Three classes of construction combined with three wheel designs provide the utmost in selection choice.

## DESIGN FEATURES

- Rugged PLR backward inclined wheels, Sizes 12"-73".\*
  - Capacities to 200,000 CFM.
  - Pressures to 14"WG.
  - Complete AMCA Class 1, 2, and 3 performance.\*
  - Efficiencies beyond 85%.
  - Temperatures to 650°F.
  - Choice of direct-drive [see page 6] or belt-drive [see page 7] arrangements.
  - Available in clockwise and counterclockwise rotations in any of seven standard discharge positions.
- \* See pages 6 and 7 for additional sizes and classes.

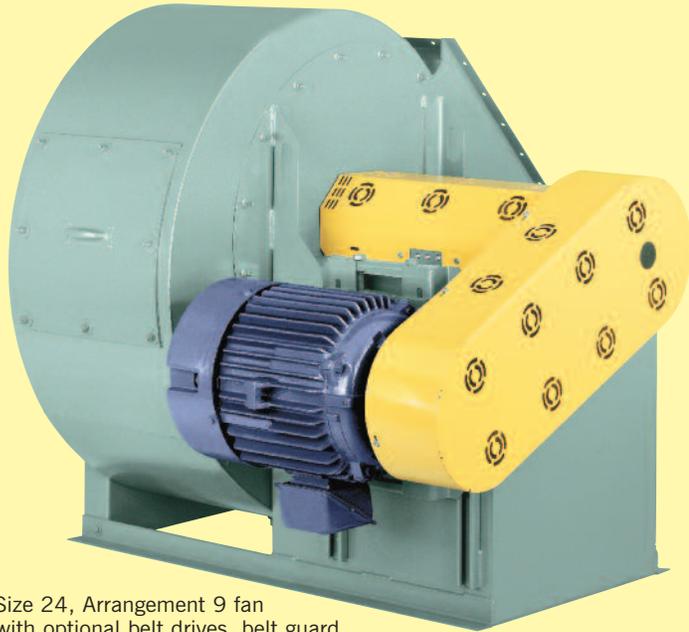

## CONSTRUCTION FEATURES

- Heavy-gauge welded components provide structural strength and durability.
- Continuously welded housings provide the strongest possible construction.
- Shafting is straightened to close-tolerance to minimize "run out" and ensure smooth operation.
- Lifting eyes are standard on all fans.
- Wheels are dynamically balanced and all fans are checked at the specified running speed.
- Bearings are selected to provide long service life through the entire operating range of the fan.

## ELECTRONIC CATALOG

A complete windows-based Electronic Catalog is now available on disk to assist in fan selection.

Size 24, Arrangement 9 fan with optional belt drives, belt guard, shaft and bearing guard, flanged outlet, bolted cleanout door, and motor.

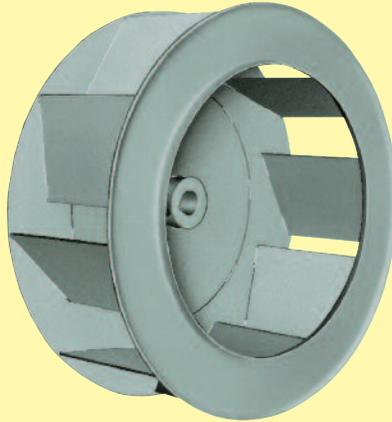

Size 24, Arrangement 8 fan with optional stainless-steel airstream, flanged inlet, flanged outlet, shaft and bearing guard, coupling, coupling guard, and motor.

Niagara Industrial Equipment Corp certifies that the Single Width PLR Fans shown on pages 10 through 12 shown herein are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program.

# PLR WHEEL DESIGNS

Three wheel designs provide the widest choice in application suitability, efficiency, sound, and cost. All three feature the backward-inclined, non-overloading horsepower characteristic where the horsepower reaches a peak and then decreases even as flow increases. This characteristic allows maximum brake horsepower calculation and motor selection that prevents electrical system overloading even if system pressure changes.

## PLR

### WHEEL DESIGN

Flat, single-thickness, backwardly inclined blades are suited to applications from clean air to those where dust and limited material is present in the airstream and airfoil shapes are not recommended due to material build-up.

### EFFICIENCY

Peak efficiency point is on the steeply rising portion of the pressure curve and vastly superior to forward curved and radial wheel designs.

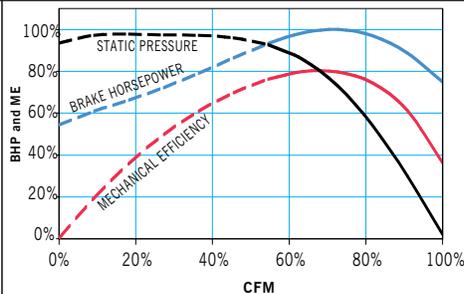

### SOUND

Sound levels are the lowest with the most efficient fan selections.

### CONSTRUCTION

Sizes 12 to 73 available in all-welded steel and also optional aluminum and stainless steel.

### PERFORMANCE

# ACCESSORIES

Size 24, Arrangement 9 fan with optional inlet box, flanged inlet and outlet, outlet damper, shaft and bearing guard, belt guard, bolted cleanout door, and motor.

Size 22, Arrangement 1 fan with optional unitary base, flanged inlet and outlet, discharge damper, shaft and bearing guard, bolted cleanout door, motor and slide base, and gray epoxy coating.

## FLANGES

**Outlet flange** angles welded flush with fan outlet and provided with holes...**inlet flange** angle ring welded to inlet collar and provided with holes...**companion flange** with matching hole pattern also available.

## DRAIN

Welded tank flange, 1" on sizes up to 15 ...1½" on Sizes 18 and larger, located at the lowest point in the housing scroll.

## SHAFT SEAL

Ceramic-felt seal elements are encased between metal backing plate and retaining disc...elements can be easily split for field installation and maintenance...lubricated lip seals are also available.

## UNITARY BASE

Structural steel or formed channel base provides common support for fan, motor, and drive components...also available with **spring-type** or **rubber-in-shear isolators**...flexible duct connections are recommended for use with isolation bases.

## INLET BOX

Minimizes entry losses normally associated with 90° turns at or near fan inlet...also available with parallel-blade damper for efficient volume control...refer to separate Catalog Sheet.

## CLEANOUT DOOR

Three types of gasketed doors are available...**quick-opening**: latch-type door swings open on hinges after turning cam levers...**bolted**: closely spaced studs keep door securely sealed...**raised bolted**: allows for insulation when desired, door raised 2" from the fan housing.

## SAFETY EQUIPMENT

Belt guards, shaft and bearing guards, coupling guards, inlet guards, and outlet guards are available.

## DAMPERS

**Internal inlet-vane**—available in Sizes 18 and larger...allows smooth control in systems that require efficient dampening of airflow...damper is an integral part of the fan inlet cone providing considerable space savings...quick-opening cleanout door is furnished that will provide easy access to linkage components...external inlet-vane dampers are also available. See separate Engineering Supplement for detailed performance characteristics.

**Parallel-blade and opposed-blade outlet**—available for volume-control applications at temperatures to 650°F. See Catalog Sheet and Engineering Letter.

# MODIFICATIONS

## HANDLING CORROSIVES

Protective coatings, special alloys, and FRP construction are available to combat corrosion problems.

**Special coatings [up to 12 mil thickness]**—special paints and spray coatings are available under a variety of trade names. **nyb** works with experienced coating applicators who can apply coatings to meet a wide range of requirements.

**Alternate-material construction**—Single-Width Fans can be constructed of aluminum or various stainless steels.

## HEAT-FAN CONSTRUCTION

Arrangement 1, 8, and 9 fans can be constructed for elevated-temperature operation with the addition of shaft cooler and guard and high-temperature paint for 650°F. maximum airstream temperature. Arrangement 9 fans are also furnished with motor heat shield. If optional shaft seal is selected, a recessed cone is furnished. Note that the maximum safe wheel speeds decrease as airstream temperatures increase...see Chart I on page 9.

## SPARK-RESISTANT CONSTRUCTION [SRC]

Intended to minimize the potential for any two or more fan components to generate sparks within the airstream by rubbing or striking during operation.

The following types are available:

### AMCA A [AIRSTREAM] SRC

To include all airstream parts constructed of a spark-resistant alloy...maximum temperature: 200°F.

### AMCA B [WHEEL] SRC

To include the fan wheel constructed of a spark-resistant alloy and a buffer plate around the housing shaft-hole opening...maximum temperature: 200°F.

### AMCA C [BUFFER] SRC

To include a spark-resistant alloy buffer affixed to the housing interior adjacent to the wheel backplate, a spark-resistant alloy inlet cone, and a buffer plate around the housing shaft-hole opening...maximum temperature: 650°F

## ALL TYPES SRC

Fan is to be so constructed such that no bearings, drive components, or electrical apparatus are located in the airstream...the user must electrically ground all fan and system components.

Refer to Engineering Letter 15 for the full meaning and limits of spark-resistant construction.

## FRP FANS

**nyb** manufactures a complete line of fiberglass-reinforced plastic fans for applications requiring the handling of corrosive fumes...see separate bulletins.

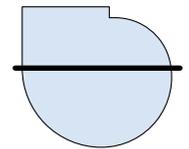

## SPLIT-HOUSING CONSTRUCTION

Available with standard construction for:  
Sizes 40-73 Class I and II  
Sizes 36-73 Class III  
Sizes 36-73 Class I, II, and III Arrangement 3

### TYPE A

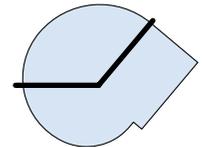

**Bottom Horizontal  
Up Blast  
Down Blast**

Horizontal split allows removal of top section without disturbing inlet connection...outlet connection must be broken on Up Blast fans only.

### TYPE B

**Top Horizontal  
Top Angular Down  
Bottom Angular Up  
Top Angular Up**

Split allows removal of pie-shaped section without disturbing inlet or outlet connections.

## SAFETY EQUIPMENT

Safety accessories are available from **nyb**, but selection of the appropriate devices is the responsibility of the system-designer who is familiar with the particular installation, or application, and can provide for guards for all exposed moving parts as well as protection from access to high-velocity airstreams. Neither **nyb** nor its sales representatives is in a position to make such a determination. Users and/or installers should read "Recommended Safety Practices for Air Moving Devices" as published by the Air Movement and Control Association International, Arlington Heights, Illinois.

# DIRECT-DRIVE ARRANGEMENTS

See Catalog Sheet CS 135, Arrangement 4 fans, and Bulletin 161, Class 4 Fans, for additional information on these models including performance, dimensions, and limitations.

## APPLICATION CONSIDERATIONS

As compared to belt-drive fan arrangements, direct-drive Arrangement 4 fans of all styles, where the fan wheel mounts directly onto the motor shaft, are more compact, require less maintenance, and generally have a lower first cost. However, relative to belt-drive fans, they are limited in application, size, available features, and the ability to adjust performance. Direct-drive Arrangement 8 fans offer much of the flexibility of belt-drive fans and are even preferred in systems that require large volumes of air and are over 250-300 HP due to drive limitations.

A major objection to direct-drive arrangements in the past was the inability to adjust fan speed if system requirements changed. With the advent of variable frequency drives (VFDs) the speed, and therefore performance, of direct-drive fans can now be adjusted to meet varying requirements. See page 8 for additional fan-control information. Given the variety of operating speeds available, choices in wheel width, and its effect on wheel safe speed limits, the only cost-effective method for selecting today's direct-drive fans is software selection programs such as New York Blower's Electronic Catalog.

## SIZE/ARRANGEMENT AVAILABILITY

Wheel	Class	Arrangement				
		4	4-F	4-H	4-V	8
PLR	1	-	-	-	-	12-73
	2	10-33	10-33	10-22	10-33	12-73
	3	16-33	16-33	16-22	16-33	18-73
	4	20-27	20-27	20-22	20-27	18-73

Wheel diameter in inches.

## ELECTRONIC CATALOG

Fan-selection program corrects for altitude, temperature, rarefaction, adjusts maximum safe speed for wheel width, and generates performance curves.

### ARRANGEMENT

## 4

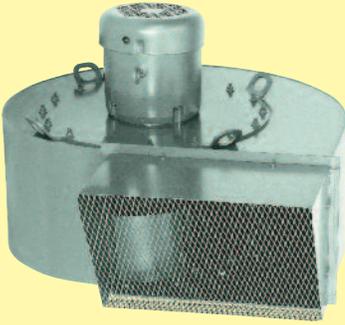

Traditional arrangement utilizing fan pedestal and foot-mounted motor. Seven discharge positions are available to meet requirements.

Max. temperature: 180°F.

### ARRANGEMENT

## 4-F

Most compact arrangement with motor mounting directly to housing and fan flush-mounted to the customer's mating surface.

Max. temperature: 120°F.

### ARRANGEMENT

## 4-H

Designed for mounting so the fan shaft is horizontal. Motor mounts directly to the fan housing. Fan is flange-mounted to the customer's mating surface.

Max. temperature: 120°F.

### ARRANGEMENT

## 4-V

Similar to the 4-F. Designed for mounting so the fan shaft is vertical. Motor mounts directly to fan housing. Fan is flange-mounted to the customer's mating surface.

Max. temperature: 120°F.

### ARRANGEMENT

## 8

Integral pedestal furnished for the motor and coupling. Most flexible of the direct-drive arrangements allowing for larger motors, fan sizes, and accessories.

Standard max. temp.: 300°F.  
Heat fan max. temp.: 650°F.

# BELT-DRIVE ARRANGEMENTS

See Bulletin 051, General Purpose Packaged Fans, for additional information on Arrangement 10 models including performance, dimensions, and limitations.

## APPLICATION CONSIDERATIONS

As compared to direct-drive fan arrangements, belt-drive fans, where the fan wheel is supported by a shaft and bearings and driven by belts, allow for a wider range of sizes and applications, and offer a greater selection of accessories and modifications. However, relative to direct-drive fans, they have a larger footprint for a given fan size and have a higher first cost. Without additional controls, belt-drive fan performance can be easily altered in the field by changing sheaves and belts. Because of the numerous choices available between belt-drive and direct-drive arrangements, it is recommended that you consult your New York Blower representative for selection guidelines.

## SIZE/ARRANGEMENT AVAILABILITY

Wheel	Class	Arrangement			
		1	3	9	10
PLR	1	12-73	24-73	12-73	-
	2	12-73	24-73	12-73	12-36
	3	18-73	27-73	18-73	-
	4	18-73	30-73	-	-

Wheel diameter in inches.

### ARRANGEMENT

# 1

Overhung wheel keeps bearings out of airstream. Motor mounts independently from fan. Greatest flexibility.

Standard max. temp.: 300°F.\*  
Heat fan max. temp.: 650°F.\*

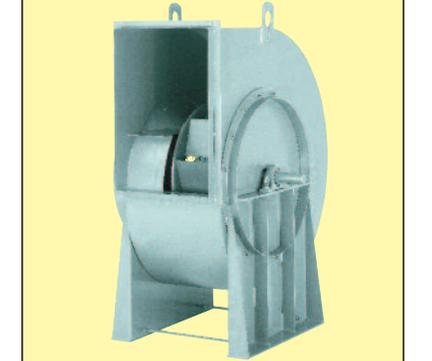

### ARRANGEMENT

# 3

Wheel supported between bearings is compact and suitable for clean, dry-air service.

Max. temperature: 120°F.

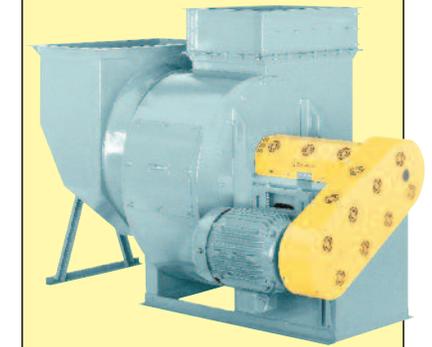

### ARRANGEMENT

# 9

Similar to Arrangement 1 but with motor mounted on side of fan pedestal reducing overall size and field-installation costs.

Standard max. temp.: 300°F.\*  
Heat fan max. temp.: 650°F.\*

### ARRANGEMENT

# 10

Compact, packaged design with motor mounted within the fan pedestal. Minimum field installation labor required.

Standard max. temp.: 200°F.\*  
Heat fan max. temp.: 650°F.\*

\*Limit for Sizes 12 and 15 fans with AcustaFoil wheels is 200°F.; heat-fan construction not available.

## V-BELT DRIVES

In the lower horsepower ranges, V-belt drive selection is relatively simple, but as horsepower requirements increase, V-belt drive selection becomes more complicated and requires more consideration of the drive's effects on fan and motor bearings.

A few general recommendations to remember are:

1. 3600 RPM motors are not generally recommended for belt-drive above 20 HP.
2. 1800 RPM motors are not generally recommended for belt-drive above 300 HP.
3. When motors 200 HP and larger are to be used with belt-drive fans, **nyb** requires that the motor manufacturer:
  - a. Recommend the minimum diameter motor sheave that may be used.
  - b. Recommend the maximum motor-sheave width that may be used.

With the above information from the motor manufacturer, the drive may be selected.

# FAN ENGINEERING AND SELECTION

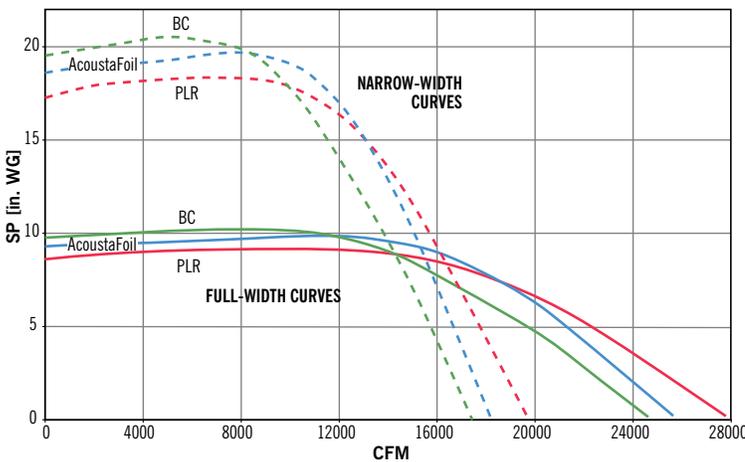

## GENERAL

Fans are an integral part of the systems in which they are applied. As such, New York Blower sales representatives work closely with design engineers in assessing requirements and meeting critical performance and dimensional specifications. Because of the wide variety of choices available, it is recommended that selection be made using New York Blower's Electronic Catalog software and that a New York Blower sales representative assist in optimizing the final selection.

## WHEEL SPEED VS. WIDTH

A major component in the determination of wheel maximum safe speed is blade strength. Narrower wheels are inherently stronger, permitting higher wheel maximum safe speeds. Using a variety of engineering tools such as a finite element analysis, New York Blower can now provide performance selections previously unavailable. For example, the direct-drive performance curves shown here illustrate maximum performance capabilities with full-width wheels [solid lines] and maximum performance capabilities with narrow-width wheels [dotted lines] at 70°F. Note that the pressure generating capability approximately doubles. Final selection of direct-drive fans can only be optimized using **nyb** Electronic Catalog software.

### SIZE 30 CLASS II FAN PERFORMANCE

## HEAT FANS

Fans handling hot airstreams must be kept in operation after system shutdown until the airstream cools below 200°F. to prevent damage to the fan. The fan wheel or shaft might otherwise distort due to "heat-soaking." The shaft cooler is only effective while rotating. Burners should be located so that the air is thoroughly mixed before entering the fan inlet. Improper placement could cause hot spots on the fan wheel which exceed maximum design temperatures. Contact **nyb** when the application involves temperature changes greater than 20°F per minute.

Refer to the selection example on page 9 for the effect of temperature on the maximum safe speed of wheels and the temperature derate factors in Chart I.

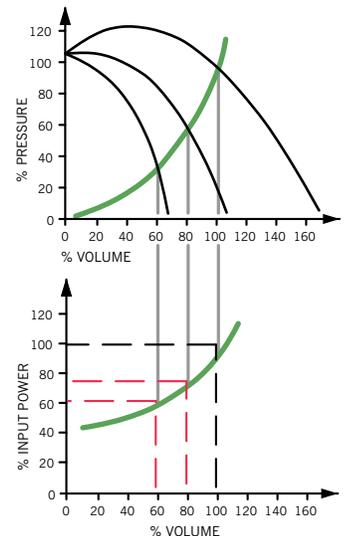

## CAPACITY CONTROL

The rising cost of energy requires that air-handling systems be operated efficiently at less than maximum design airflow. The high efficiency and inherent stability of the AcoustaFoil wheel is particularly well-suited to variable airflow systems. The AcoustaFoil wheel design ensures not only maximum operating efficiency at design CFM but also at reduced airflow regardless of the control method applied. This higher efficiency allows quieter operation throughout the modulation range.

The New York Blower Company's nationwide network of trained sales representatives is familiar with each of these control alternatives and can offer further assistance in selecting the best control for a particular application.

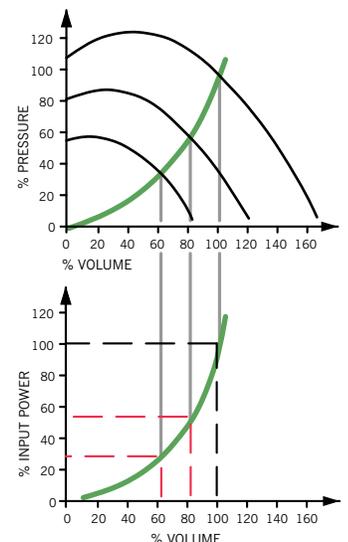

### INLET-VANE DAMPER CONTROL

Inlet-vane dampers affect the fan's output by spinning the air in the direction of wheel rotation. With this pre-spin, the wheel cannot develop its full output, yielding a reduced CFM at reduced horsepower. Each damper setting creates new pressure and horsepower curves. With inlet-vane dampers, reduced airflow always results in reduced horsepower.

### VARIABLE FREQUENCY MOTOR SPEED CONTROL

Variable frequency motor speed controllers provide energy savings by directly controlling fan speed. From the fan laws, CFM varies directly with the change in fan speed and horsepower varies by the change in fan speed cubed. For example, a 20% reduction in fan speed yields a 20% reduction in airflow and a 49% reduction in BHP. Controllers must have lockouts to prevent operation beyond the maximum safe speed of the fan.

# How to Use Performance Tables

For a given fan size, wheel design, CFM, and static pressure, performance tables can be used to obtain outlet velocity, fan RPM, and BHP. If capacities are at conditions other 70°F., sea level, or standard density [.075 lb./cu.ft.], correction factors must be applied to static pressure and BHP.

PROCEDURES	STEPS	EXAMPLE: A fan is required for 13,000 CFM at 4"WG at 600°F. and sea level.
If conditions other than standard are involved, correct static pressure for actual altitude and temperature using Charts II and III.	1	Chart II gives a 2.00 factor for 600°F. Corrected SP is 4"WG x 2.00 = 8"WG at 70°F. Select fan from performance tables for 13,000 CFM at 8"WG.
Select size, wheel type, RPM, and BHP of fan from performance table.	2	A Size 30 with AcoustaFoil wheel is selected for 13,000 CFM at 8"WG at 1650 RPM and 20.5 BHP.
Check maximum safe speed of fan at operating temperature as shown in the performance tables and Chart I.	3	From the performance table and Chart I, the maximum safe speed of a Size 30 fan with Class 2 AcoustaFoil wheel at 600°F. is 1660 RPM [1805 x .92]. Fan is satisfactory for operation at 600°F.
Determine actual performance at operating conditions by correcting SP and BHP.	4	Actual performance: 13,000 CFM at 4"WG [8" ÷ 2.00] at 1650 RPM at 10.3 BHP [20.5 ÷ 2] at 600°F.

## PERFORMANCE CORRECTION FACTORS

Fan performance is based on actual feet per minute [ACFM] at the fan inlet at standard density [.075 lbs./ft.<sup>3</sup>] and static pressure at the fan outlet. Static pressure capabilities are shown in inches water gauge ["WG].

Air-density corrections are necessary for proper selection when air density varies from the standard .075 lbs./ft.<sup>3</sup> at 70°F. at sea level. Multiply the required static pressure at operating conditions by the appropriate factors in Charts II and III to obtain the corrected static pressure for standard conditions. Pressure and BHP will be reduced at conditions by the inverse of these factors. Multiply one factor by the other if temperature and altitude are non-standard. For example: if the installation is located at an altitude of 4000 feet and the gas temperature is 300°F. the correction factor is 1.66 [1.16 x 1.43]. Temperature and altitude correction is made automatically using New York Blower's Electronic Catalog software.

## MAXIMUM SAFE SPEED INFORMATION

Each performance table on pages 10-17 includes the maximum safe speed of the standard wheel at 70°F. Fan operation at temperatures above 70°F. primarily affects the strength of rotating components, which declines as temperature increases. When alloy construction is specified or when temperatures are involved, multiply the appropriate safe operating speed shown in the performance table by the factor shown in Chart I. Note that Sizes 12 and 15 AcoustaFoil wheels are aluminum as standard. Also that the maximum safe speeds apply only to wheels operated at or below 70°F. and are free of material build-up, corrosion, or wear. See discussion on page 8 regarding direct-drive fans and maximum safe wheel speeds for wheels that are narrow-width. Maximum wheel safe speeds are computed automatically using New York Blower's Electronic Catalog software.

## CHART I

TEMPERATURE CORRECTION FACTORS FOR WHEEL OPERATING SPEEDS

Temp. °F.	Wheel material				
	Steel	Aluminum	Stainless 304*	Stainless 316*	Stainless 347*
-50	1.00	1.00	1.00	1.00	1.00

Performance certified is for installation Type B: Free inlet, Ducted outlet. Power rating (BHP) does not include transmission losses. Performance ratings do not include the effects of appurtenances (accessories).

# MOTOR PEDESTAL DIMENSIONS, CAPABILITIES

## ARRANGEMENT 8 MOTOR PEDESTAL DIMENSIONS

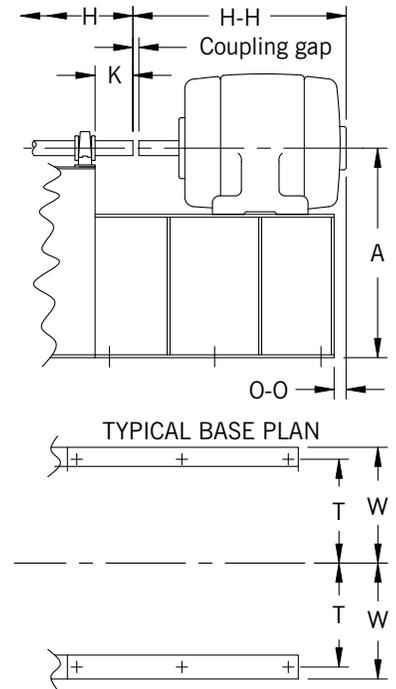

These approximate dimensions can be used to estimate the overall size of Arrangement 8 fans. Add the appropriate dimensions below to the fan dimensions on page 22.

Note: Coupling gap is based on the Falk Steelflex coupling sizes shown. As the gap will vary with other coupling sizes or types, so will the Arrangement 8 motor pedestal dimensions. Specific motor and coupling data is required to determine exact dimensions.

\*H-H and 0-0 based on several major motor manufacturers—consult **nyb** for exact dimensions. Tolerance:  $\pm 1/8"$

## ARRANGEMENT 9 PEDESTALS—MOTOR SIZE CAPABILITY

Arrangement 9 is a space-efficient package consisting of fan, motor, V-belt drive, and accessories. Motors are mounted on the left or right side of the pedestal as space permits. C-NW is not a NEMA standard dimension and varies by manufacturer. As a result, C-NW must be checked in every instance. To determine if Arrangement 9 is a workable configuration, compare the desired motor's frame size with the frame size shown for the appropriate fan below. If the frame size and C-NW dimension are no larger than that shown, the combination is satisfactory. In all cases, C-NW is the final determining factor. The C-NW dimension for the desired motor must be equal to or less than the maximum shown. If the C-NW dimension is larger than that shown, a different motor, fan, or arrangement must be selected.

Motors on 326T frames and larger should be checked for weight. Arrangement 9 fans can accommodate motors weighing up to 600 lbs. Arrangement 9 fans provisioned with heavy duty slide rails can accommodate motors weighing up to 1000 lbs. Arrangement 1 fans with unitary bases are required for motors weighing more than 1000 lbs. Tolerance:  $\pm 1/8"$

# FLANGE DIMENSIONS

## FLANGED INLET OPTION

Holes furnished on vertical centerline.

**Note:** Inlet-flange angles:

† Dimensions may vary with narrow-width construction.

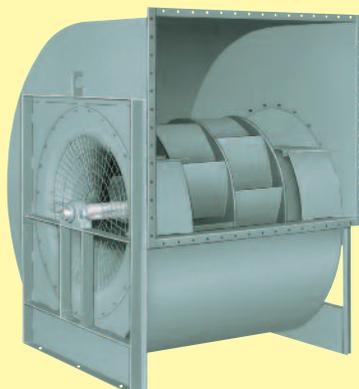

Tolerance: ± 1/8"

• Dimension shown is inside flange, outside housing, Deduct housing material thicknesses to determine inside dimensions of discharge.

\* Materials of construction for mild steel only. Alloy construction uses angle on all sizes. A and B dimensions will vary in Sizes 12-22.

# UNIQUE FANS FOR AIR-HANDLING

## DOUBLE-WIDTH ACOUSTAFOIL

### Capacities to 350,000 CFM, 14" WG

A complete double-width offering to suit AMCA Class 1, 2, and 3 performance standards...airfoil-wheel design for quiet, efficient performance with non-overloading horsepower characteristic... stable performance, when coupled with **nyb** inlet dampers, is particularly well-suited to the variable-air-volume systems.

## PLENUM

### Capacities to 180,000 CFM, 13" WG

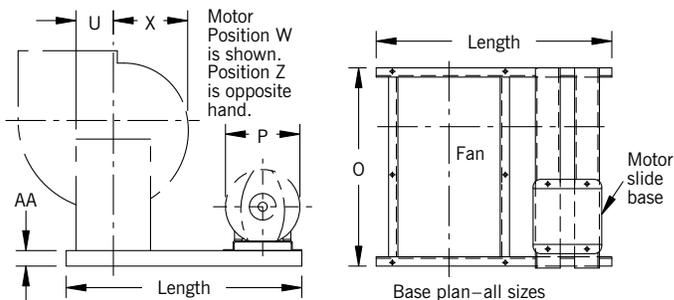

Ideal for packaged or built-up air-handling systems where reduced size and weight is critical... available with two wheel choices: high-efficiency AcoustaFoil and ultra-quiet AcoustaFoil-Q... consider New York Blower Plenum Fans for the utmost in system value and application flexibility.

# UNITARY BASE DIMENSIONS

Structural-steel channel base provides a factory-designed package of Arrangement 1 or 3 fan, motor, drive, and guard. Also available with rubber-in-shear or spring isolation. Built-in motor rails provide for adjustment of belt tension.

Unitary base with isolation is also available for Arrangement 4, 8, and 9 fans.

**NOTE:** Down Blast discharge requires special construction. Also, some larger fans on unitary bases cannot be shipped as an assembled package.

Approximate base length =  $U + X + P + 16$

U = from fan base dimension drawing on pages 22 and 23.

X = dimension from fan centerline to edge of scroll nearest motor. Dimension varies with discharge and motor position. Refer to dimensional drawings on pages 22 and 23.

P = diameter of motor from table at upper right.

16 = constant—allows for motor clearance.

**NOTE:** These dimensions are only approximate. Exact dimensions furnished after order is placed.

## AMCA STANDARD MOTOR-POSITION DESIGNATIONS

Arrangement 1 and 3 motor positions are independent of fan rotation and discharge. Position is determined from drive end of fan shaft as shown in drawing at right.

# HEAVY-DUTY FANS FOR HIGHER PRESSURES

## CLASS IV

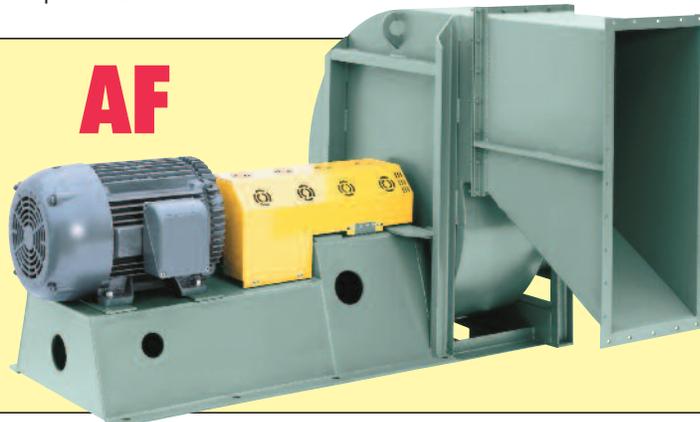

Capacities to 170,000 CFM, 20" WG

A heavier-duty extension of the Single-Width Fan design for higher pressure requirements...choice of two wheels for best efficiency: AcoustaFoil for clean, dry airstreams and PLR for moderate amounts of dirt and moisture...temperatures to 750°F.

Capacities to 130,000 CFM, 50" WG

Airfoil-wheel design for high efficiency with non-overloading horsepower characteristic featuring curves which cover a wide range of narrow-width performance at direct-drive motor speeds... well-suited to higher horsepower required for high-pressure performance.

## AF

## FAN DISCHARGES – VIEWED FROM DRIVE SIDE

Clockwise—angular discharges at 45°

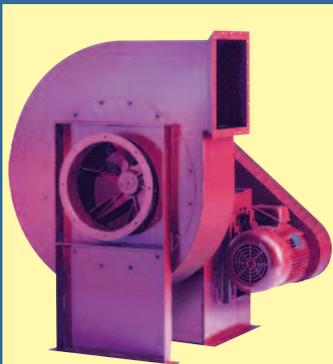

Counterclockwise—angular discharges at 45°

★ Down Blast and Top Angular Down discharge positions must be evaluated for clearance of accessories such as flanged outlet, outlet damper, unitary base, etc. Consult **nyb** with specific details.

The New York Blower Company has a policy of continuous product development and reserves the right to change designs and specifications without notice.

# COMPLETE SELECTION OF AIR-MOVING EQUIPMENT

The New York Blower Company offers thousands of different types, models, and sizes of air-moving equipment. Contact your nyb representative for assistance in identifying the best fan for your application.

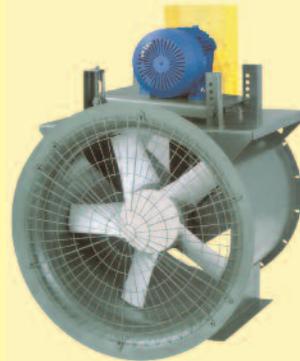

## DUST/MATERIAL HANDLING

Wide range of duty available with unique fan lines capable of handling light dust to heavy material. Typical applications include dust-collection and high-pressure process along with material-conveying.

## AIR-HANDLING [CENTRIFUGAL]

Designed for clean to moderately dirty gas streams. Commercial and industrial HVAC, process cooling, light material-conveying, heat removal, and dryer exhaust are just a few of the numerous sample applications.

## AIR-HANDLING [AXIAL]

For the ideal handling of clean to moderately dirty airstreams. Commercial and industrial HVAC, drying and cooling systems, fume extraction, and process-heat removal are typical applications.

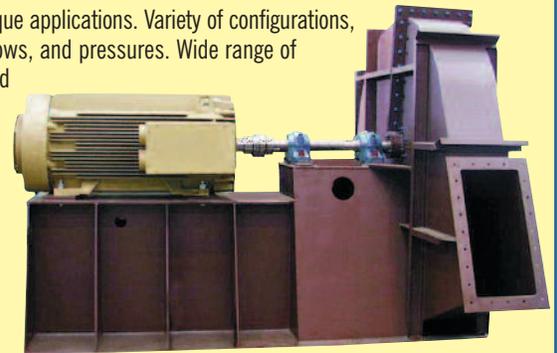

## FIBERGLASS REINFORCED PLASTIC [FRP]

Choice of performance and duty for corrosive gas streams. Applications include chemical process, wastewater treatment, laboratory hood exhaust, and tank aeration.

## CUSTOM PRODUCTS

Designed for unique applications. Variety of configurations, temperatures, flows, and pressures. Wide range of modifications and accessories are available to meet the most demanding specifications.

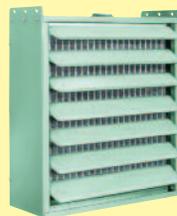

# Leading the industry forward since 1889

## ROOF VENTILATORS

Including both hooded and upblast ventilators, propeller fans, and centrifugal roof exhausters. These units are ideal for industrial, commercial, and institutional applications.

## HEATING PRODUCTS

Industrial-duty steam unit heaters with steam heating coils are available for facility heating and process-heat transfer.

## PROCESS/FAN COMPONENTS

Plug fans, plenum fans, wheels, inlet cones, and housings for a wide variety of OEM applications. Process/fan components are used in air-handling units, ovens, dryers, freezer tunnels, and filtration systems.
