Water Penetration

Test Size 48 in. x 48 in. (1219 mm x 1219 mm) Test duration of 15 minutes

— Water Penetration per Free Area X Beginning of Water Penetration

The AMCA Water Penetration Test provides a method for comparing various louver models and designs as to their efficiency in resisting the penetration of rainfall under specific laboratory test conditions. The beginning point of water penetration is defined as that velocity where the water penetration defined as that velocity where the water penetration curve projects through 0.01 oz (3 g) of water (penetration) per sq. ft. (m²) of louver area. ** The beginning point of water penetration for model 104-45 is 807,4 fpm free area velocity. These performance ratings do not guarantee a louver to be waterproof or stormproof and should be used in combination with other factors including good engineering judgement in selecting louver model.

Pressure drop

Test Size 48 in. x 48 in. (1219 mm x 1219 mm)

The resistance to airflow (pressure drop) varies depending on louver application (air intake or air exhaust). Free area velocities (shown) are higher than average velocity through the overall louver size.

CERTIFICATION AMCA

Cometal inc. certifies that the 104-45 louvers shown herein are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 511 and comply with the requirements of the AMCA Certified Ratings Program. The AMCA Certified Ratings Seal applies to Water Penetration and Air ratings. Louver were tested in accordance with AMCA Standard 500-L.
