

HEE-Duall

A CECO Environmental Brand

Air Pollution Control Products

HPCA Series

FRP Centrifugal Airfoil Fans

Construction Features

SHAFT SEAL

A neoprene shaft seal is used to prevent leakage of corrosive fumes which could damage the bearings and the shaft. The elastomer seals against the fiberglass shaft sleeve.

SHAFTS

All HPCA series fans utilize a turned ground and polished carbon steel shaft material. Stainless steel is available for special orders on request.

BEARINGS

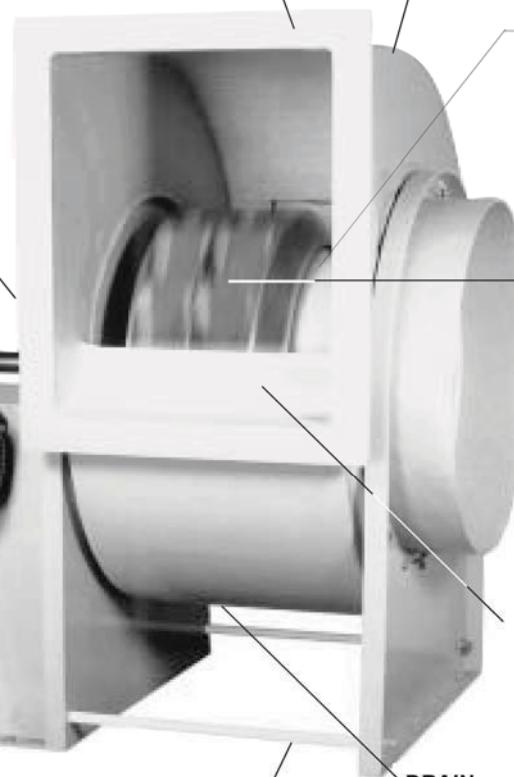

Grease lubricated fully self-aligned pillow block ball bearings are standard equipment. Minimum starting friction, simple maintenance and long, trouble-free life expectancy, make them ideal for fan service.

BASE

The heavy duty base is sand blasted to white metal and powder coated with a hybrid epoxy urethane blend and oven cured to provide an acid-caustic resistant coating system.

OUTLET FLANGES

The flanges are standard on all HPCA series centrifugal fans. The heavy duty, undrilled flange has a smooth sealing face. Drilling is available as an option.

**HOUSING DESIGN**

The spiral shaped housing is designed to collect the air leaving the periphery of the wheel and reduce its velocity with a minimum of turbulence, thereby efficiently converting velocity pressure to static pressure for increased performance.

STREAMLINED INLET CONE

A new and improved inlet cone has been provided allowing the correct overlap into the wheel. This design allows the correct air entry into the wheel and prevents leakage.

FIBERGLASS CENTRIFUGAL AIRFOIL WHEEL

The backward-inclined airfoil wheel has ten airfoil profile blades with a vinyl ester resin exterior and a high density light weight interior allowing Class III speeds. The imbedding hub is bolted and bonded to the backplate and permanently encased with a FRP cover.

CUTOFF PLATE

An extended and redesigned cutoff plate has been designed for this new airfoil wheel to provide maximum efficiency.

DRAIN

Every Harrington centrifugal exhaust fan is supplied with a 1" threaded drain outlet located in the bottom most position of the housing.

REINFORCING RODS

The rods are encapsulated in polyvinyl chloride and provide maximum rigidity to the front support frame.

FEATURES AND GENERAL INFORMATION

Air Movement and Control Association Seal

Met-Pro Technologies d/b/a HEE Enviro. Eng. & Duall Air & Water Technologies certifies that the HPCA series FRP centrifugal Airfoil fans shown herein are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program.

The HEE-Duall backward inclined Airfoil wheel is the result of years of design and experimentation. This unique Airfoil blade profile is a composite structure consisting of a premium grade vinyl resin fiberglass exterior and high density light weight interior. This modern construction provides excellent chemical resistance to a wide variety of corrosive chemicals and is practically impervious to most chemicals. The light weight construction and unique Airfoil profile shape allows operation at higher speeds up to Class III construction without distortion or bond separation and allows pressures up to 18 inches WG.

FAN SELECTION AND PERFORMANCE

The Performance Tables shown in this brochure are based on unobstructed air flows into the inlet of the fan. During installation, the fan inlet conditions should be designed to allow the air to enter the housing resembling a fan with an unobstructed inlet. The fan performance can be adversely effected by poor inlet conditions creating uncontrolled spin, unequal air loading or imbalance. Elbows located directly at the inlet should be avoided and properly sized inlet boxes or straightening vanes should be utilized. It is good practice to include the equivalent of two duct diameters prior to the fan inlet.

The addition of a short outlet stack will improve the overall performance of the fan. Testing has shown up to a 7% improvement in performance by the addition of an outlet stack.

The BI Airfoil wheel blades provides non-overloading performance. This allows the brake horsepower to level off at a point where motors can be economically selected so they will not overload if the system pressure drops.

The brake horsepower shown in the performance tables does not include the drive or belt losses. Normally, the belt drive losses vary from 5% to 20% of the motor horsepower output.

The estimated belt loss can be obtained using the table located on page 4.

The ultimate measure of fan performance is operating efficiency. High efficiency means lower operating cost throughout the life of the equipment. The HPCA Airfoil design provides static efficiencies up to 83%. This feature will provide a tremendous energy savings.

Fourteen sizes are available from models HPCA 2000 to 7300. Harrington recommends using the flat blade backward inclined model HPC series, on fans below the HPCA 2000 model, since the merits of airfoil are lost in smaller fan sizes.

All HEE-Duall HPCA series Centrifugal Airfoil fans conform to ASTM D4167 standard specifications for fiber reinforced plastic fans and blowers. For applications requiring an additional corrosion barrier, Harrington recommends an interior veil on the fan scroll providing a resin-rich layer.

All wheels are statically and dynamically balanced on electronically controlled balancing machines. The necessary weight adjustments are made by removing excess material, or by permanently bonding fiberglass material to the wheel. After completed fan assembly, the fans are test run at the customers operating speed to locate and correct any minor misalignment that may have occurred during assembly. They are checked for proper bearing operation.

Sound information is available from HEE-Duall. This data is the result of laboratory testing based on AMCA standard 300 and processed by the procedures shown in AMCA Bulletin 301. The AMCA Certified ratings seal applies to air performance only.

FAN SELECTION AND PERFORMANCE

The chemical and structural properties of fiberglass are excellent. FRP fans moving air at higher temperatures will usually effect the chemical resistance. In addition, the maximum safe speeds should be de-rated using the following table:

| MAXIMUM SAFE SPEED CORRECTION FACTORS | | | | |
|---------------------------------------|-----|-----|-----|-----|
| Temperature (°F) | 70 | 100 | 150 | 175 |
| Factor | 1.0 | 1.0 | .95 | .93 |
| | | | | .91 |

To obtain the new maximum safe speed when temperature is involved, multiply the maximum safe speed as listed for each fan size by the correction factor.

Each of the following capacity tables include a CFM, static pressure, outlet velocity and the corresponding RPM and BHP. If capacities are not at standard conditions (70 degrees F at sea level) or at standard density of .075 pounds/Cu.Ft., correction factors must be applied to static pressure and BHP. The most efficient fan operation above the solid black line represents peak efficiency and the most quiet performance.

Fan performance is shown for Class I, II and III. The maximum safe tip speed for each construction is 10,000, 14,000 and 17,000 feet per minute. The capacity table also includes the maximum fan PRM for each Class construction

ACCESSORIES AND OPTIONS AVAILABLE

ACCESS DOORS are necessary for wheel inspection and maintenance on all units which utilize a discharge stack. All access doors are bolted to the housing and include neoprene gaskets.

ARRANGEMENT 1,9, AND 8 are available per your requirements. To receive additional information on an ARRANGEMENT 8 Direct Drive fan, request our ARRANGEMENT 8 Bulletin.

BELT AND SHAFT GUARD can be used when fans are installed indoors and will cover drives, belts, bearings and fan shafts. Both guards can be easily removed for access to the drives and bearings.

DISCONNECT SWITCH can be mounted and wired or can be shipped loose for field installation. Nema 3R, 1 or 4X are available.

EXTENDED LUBE LINES can be provided allowing a convenient method of lubricating the bearings.

FLANGED INLET is permanently bonded to the attaching ring and provides a continuous surface. Drilling is available as an option. Dimensions and drilling conforms to PS 15-69 and ASTM D3982-92.

FLEXIBLE CONNECTIONS are supplied with stainless steel draw bands and are fabricated from a material suitable for service with corrosives contained in the air stream.

GRAPHITE IMPREGNATION is used for applications which handle potentially explosive fumes or gases. The interior air stream surface is coated with a graphite rich resin coat and grounding strap secured to the steel base. During installation, the steel fan frame should be grounded.

GRAVITY DAMPERS constructed of fiberglass prevent rain from entering the inlet duct work and foreign objects from entering the fan wheel during shut down periods.

INLET BOXES are fabricated of FRP and provide a convenient means of locating an inlet 90 degrees to the fan inlet with predictable entry losses.

INLET OR OUTLET SCREENS can be installed to offer protection on the inlet side from the rotating fan wheel or on the outlet to prevent foreign objects from entering the wheel housing.

INLET VANE AND OUTLET DAMPERS fabricated of FRP or 316 stainless steel provide a means of volume control with corrosion resistance. Dampers can be motorized.

INTERIOR VEIL is standard on the fan wheel blades and the back plate. If an additional barrier is required because of severe chemical service application on the fan housing interior, a veil interior can be provided on the fan housing as an option. However, the fan housing already includes a resin rich and smooth coat without the use of a surface veil.

MOTORS are available in many different enclosure types (TEFC, ODP, High Efficiency, TEEP, etc.) and voltages. Two speed motors can be supplied or Harrington can mount a customer supplied motors. TEFC Inverter Duty motors are also available.

OUTLET TRANSITIONS are machined drilled to the fan outlet flange and allow the installation of a round duct.

STACKS are available using fiberglass construction and can be built to order to include seismic and wind load calculations.

STRUCTURAL BASES come with a choice of seismic restraints. Concrete inertia bases are also available.

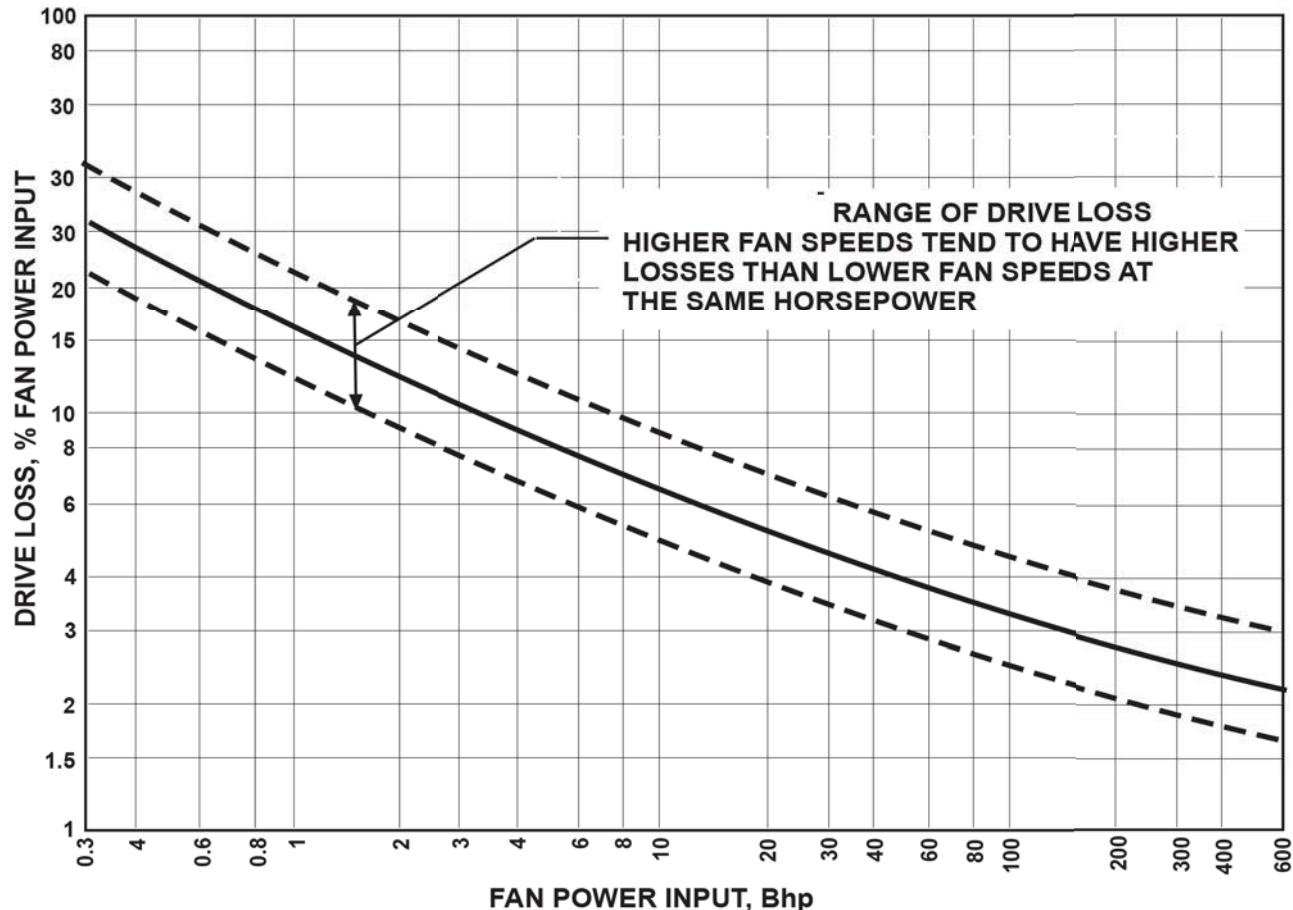

VARIABLE PITCH DRIVES are provided and will allow a ten percent adjustment of the fan RPM in either direction.

VIBRATION ISOLATORS are available in rubber or spring.

VITON SHAFT SEAL material offering superior chemical resistance can be utilized and seals against the fiberglass shaft sleeve.

WEATHER COVERS are fabricated of fiberglass reinforced plastics and are used when the fan is located outdoors. These covers are designed to provide protection of the motor, drives, shaft and bearings.

316 STAINLESS STEEL or HASTELLOY SHAFTS are available and will provide an extra degree of corrosion resistance when the fans are installed in a harsh chemical environment.

**EXAMPLE:**

- Fan power input, $H = 12.5$ Bhp (from performance tables)
- From curve, drive loss = 6%
- Drive loss, $H_L = .06 \times 12.5 = .75$ hp
- Motor power output, $H_{mo} = 12.5 + .75 = 13.25$ hp

(Based on data obtained from AMCA Applications Guide - Field Performance Measurement Publ.203)

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

AIR POLLUTION CONTROL

Fan Performance Data

SWSI BI AF
Fiberglass Centrifugal Fan

Wheel - 38.5 In. Diameter

Wheel Circumference - 10.07 Ft.

HPCA 3650 SWSI
CLASSES I, II, III
Backward Inclined - Airfoil

Outlet Area = 7.62 Sq. Ft.

992 RPM Class I 1389 RPM Class II 1687 RPM Class III

Static Pressure - Inches W.C.

$$\text{MaximumBHP} = \left(\frac{\text{RPM}}{1000} \right)^3 X 16.2$$

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

AIR POLLUTION CONTROL
Fan Performance Data
SWSI BI AF
Fiberglass Centrifugal Fan

Wheel - 69.75 In. Diameter

Wheel Circumference - 18.25 Ft.

HPCA 6600 SWSI
CLASSES I, II, III
Backward Inclined - Airfoil

Outlet Area - 25.59 Sq. Ft.

Performance shown is for installation type D - Ducted inlet, Ducted outlet.

Power rating BHP does not include drive losses.

Performance ratings do not include the effects of appurtenances in the airstream.

The most efficient fan selection appears above the solid line.

AIR POLLUTION CONTROL
Fan Performance Data
SWSI BI AF
Fiberglass Centrifugal Fan

Wheel - 77 In. Diameter

Wheel Circumference - 20.15 Ft.

HPCA 7300 SWSI
CLASSES I, II, III
Backward Inclined - Airfoil

Outlet Area - 30.34 Sq. Ft.

496 RPM Class I
694 RPM Class II
843 RPM Class III

Static Pressure - Inches W.C.

$$\text{Maximum BHP} = \left(\frac{\text{RPM}}{1000} \right)^3 X 549$$
